A terminal window titled "researchtools@ubuntu: ~" is open. The window has a menu bar with "File", "Edit", "View", "Search", "Terminal", and "Help". The terminal content shows the command "uptime" being executed, resulting in the output: "11:06:18 up 1 day, 1:11, 4 users, load average: 0.12, 0.08, 0.05". The prompt "researchtools@ubuntu:~\$" is visible at the end of the line.

```
researchtools@ubuntu:~$ uptime
11:06:18 up 1 day, 1:11, 4 users, load average: 0.12, 0.08, 0.05
researchtools@ubuntu:~$

File Edit View Search Terminal Help
Base Class: <type 'instancemethod'>
String Form: <bound method InteractiveShell.magic_logstart of <IPython.iplib.InteractiveShell object at 0xb776238c>>
Namespace: IPython internal
File: /usr/lib/python2.7/dist-packages/IPython/Magic.py
Definition: logstart(self, parameter_s='')
Docstring:
    Start logging anywhere in a session.

    %logstart [-o|-r|-t] [log_name [log_mode]]

    If no name is given, it defaults to a file named 'ipython_log.py' in your
    current directory, in 'rotate' mode (see below).

    '%logstart name' saves to file 'name' in 'backup' mode. It saves your
    history up to that point and then continues logging.

    %logstart takes a second optional parameter: logging mode. This can be one
    of (note that the modes are given unquoted):
    append: well, that says it.
    backup: rename (if exists) to name~ and start name.
    global: single logfile in your home dir, appended to.
    over  : overwrite existing log.
    rotate: create rotating logs name.1~, name.2~, etc.

Options:
:
import numpy # for NAN aka "not a number"
from matplotlib import pyplot
```

```
Applications Places System [icons]
researchtools@ubuntu: ~/class/20
File Edit View Search Terminal Help
append: well, that says it.
backup: rename (if exists) to name~ and start name.
global: single logfile in your home dir, appended to.
over  : overwrite existing log.
rotate: create rotating logs name.1~, name.2~, etc.

Options:

-o: log also IPython's output. In this mode, all commands which
generate an Out[NN] prompt are recorded to the logfile, right after
their corresponding input line. The output lines are always
preended with a '#[Out]# ' marker, so that the log remains valid
Python code.

Since this marker is always the same, filtering only the output from
a log is very easy, using for example a simple awk call:

    awk -F'#\[Out\]# ' '{if($2) {print $2}}' ipython_log.py

-r: log 'raw' input. Normally, IPython's logs contain the processed
input, so that user lines are logged in their final form, converted
into valid Python. For example, %Exit is logged as
'_ip.magic("Exit")'. If the -r flag is given, all input is logged
exactly as typed, with no transformations applied.

-t: put timestamps before each input line logged (these are put in
comments).

(END)
import numpy # for NAN aka "not a number"
```

```

The image shows a Linux desktop environment with two windows open. The background window is a terminal window titled 'researchtools@ubuntu' with a dark background and light text. It displays the output of a Python script, showing a dictionary with keys like 'xmax', 'ymin', 'xmin', and 'ymax'. The output includes values like -134.49 and 57.4. Below the output, there are two interactive prompts: 'In [67]:' and 'In [68]:', with their corresponding outputs.

In [67]: '{xmin} and {yma
Out[67]: '-134.49 and 57.
In [68]:
```

The foreground window is an Emacs editor window titled 'emacs23@ubuntu'. It shows a KML document being edited. The KML code includes a 'Placemark' element with a 'name' attribute, a 'description' element containing placeholders for title and abstract, and a 'LineString' element with a 'coordinates' attribute containing a list of coordinate pairs. The coordinates are: {xmin}, {ymin}; {xmin}, {ymax}; {xmax}, {ymax}; {xmax}, {ymin}; {xmin}, {ymin}. The Emacs window also shows a menu bar with 'File', 'Edit', 'Options', 'Buffers', 'Tools', 'Minibuf', and 'Help', and a toolbar with various icons.
