~/.bash_aliases file. Add this line:

#+BEGIN_SRC sh
# Specific to the research tools class
alias rtupdate='(cd ~/projects/researchtools; hg pull; hg update)'
#+END_SRC

The parentheses "()" around the command create a "scope" in which the
=cd= command lives. When bash gets to the right hand ")" it will back
out of the researchtools directory and leave you where you started.

These aliases are not active until you create a new terminal or source the
alias file in an existing terminal.

#+BEGIN_SRC sh
alias rtupdate # try to list the alias
# bash: alias: rtupdate: not found
source ~/.bash_aliases
alias rtupdate
# your new alias should show up

# To list all aliases:

* Command line arguments
```

```
:commandlineargs:
```

```
** TODO fileinput
```

If we were not working with binary files, we might try the [fileinput](#) module. However, I'll have to leave that for another time.

```
** searching for files with glob
```

```
:glob:
```

If we know something about the names of the files we want to work with, we can use [glob](#). Glob gives us bash command line like file name expansion with "*", "?", and "[0-9]" style expansion. Try it from inside of ipython:

```
--:--- 24-python-binary-files-part-4.org 37% L246 Hg-17 (Org)-----
```

```
Find file: ~/projects/researchtools/class/~class/24/sbet.py
```

```

```
run sbet
#+END_SRC
```

```
* Simple route with sys.argv
```

```
:sys:
```

Bet yet, the person using the sbet.py program should be able to specify which sbet files she wants to use. We can do this by using sys.argv. Check out argv from ipython:

```
#+BEGIN_SRC python
import sys
print sys.argv
```

```
# any file names specified will be after the 1st parameter, which
# is the name of the program.
```

```
print sys.argv[1:]
#+END_SRC
```

Remove the glob code from your main and replace it to use sys.argv. Your code should look like this:

```
--:-- 24-python-binary-files-part-4.org 45% L299 Hg-17 (Org)-----
```

```
'''
#+END_SRC
```

But we are missing one thing! Coordinates that are close to 0,0 are going to be a big problem! First we need a function that will test if floating point numbers are almost equal.

```
#+BEGIN_SRC python
```

```
import sys

def almost_equal(value1, value2, epsilon=sys.float_info.epsilon):
    if value1 > value2+epsilon:
        return False
    if value1 < value2-epsilon:
        return False
    return True
```

```
#+END_SRC
```

Then we need to use that to skip points of no position data at 0,0:

```
#+BEGIN_SRC python
```

```
for datagram_index, datagram in enumerate(load_sbet_file(filename)):
    x=datagram['lon_deg']
    y=datagram['lat_deg']

    if datagram_index % 10 == 0:
        print datagram_index, datagram['time'], x, y

    if almost_equal(0., x) and almost_equal(0., y):
        # skip points that are at zero,zero... no data
        # good luck if you try to survey at 0,0
        continue

* Can we make an sqlite database?

Just follow along on this one. Databases are not unlike spreadsheets,
but much easier to manage huge amounts of information. There are
tables with data. We will quick try to write an SQLite database.
Here is the command to create a database:

#+BEGIN_SRC sql
CREATE TABLE IF NOT EXISTS sbet_entry (
 time REAL,
 y REAL,
 x REAL,
