DF(1) User Commands DF(1)

NAME
df - report file system disk space usage

SYNOPSIS
df [OPTION]... [FILE]...

DESCRIPTION
This manual page documents the GNU version of df. df displays the amount of disk space
available on the file system containing each file name argument. If no file name is
given, the space available on all currently mounted file systems is shown. Disk space is
shown in 1K blocks by default, unless the environment variable POSIXLY_CORRECT is set, in
which case 512-byte blocks are used.

If an argument is the absolute file name of a disk device node containing a mounted file
system, df shows the space available on that file system rather than on the file system
containing the device node (which is always the root file system). This version of df
cannot show the space available on unmounted file systems, because on most kinds of sys-
tems doing so requires very nonportable intimate knowledge of file system structures.

OPTIONS
Show information about the file system on which each FILE resides, or all file systems by
default.

Manual page df(1) line 1

* Introduction

* Internet Relay Chat (IRC)

Start Firefox

Under "Tools," select "ChatZilla" at the bottom.

ChatZilla will use your login name (often referred to as you
"shortname") by default. You can pick anything you like, but if you
don't use something related to your name, people may have trouble
which user in a chat is you. For this class, make sure to use the
same short name as your CCOM account - please do not change your
alias.

We need to now sign into an "IRC Server" that hosts chat rooms. There
are many thousands of servers in the world and we will even setup on
at CCOM later in the semester. For now, I have created an unofficial
channel on http://freenode.net. FreeNode supports free and opensource
software and this class is primarily about just those topics. Type
this command right into the bottom window of ChatZilla:

#+BEGIN_SRC sh
/attach irc.freenode.net
/join #unhresearchtools
#+END_SRC

** Say "hi" in the IRC channel

U:--- 03-basic-command-line.org 1% (24,0) Hg:0 (Org yas Spc Fill) 12:21PM 0.91

# Editing Research Tools 2011

**B** / **Ab**

The 2011 Research Tools (ESCI 895-003) course taught by Kurt Schwehr

Auditors (official or otherwise) welcome. You will have to provide your own computer/laptop if not a registered student.

== Instructor ==

[[User:Schwehr|Kurt Schwehr]]

== Meeting Time and Location ==

- TTh 11:10-12:30
- Chase Ocean Engineering Rm 140 (Computer Classroom)

== Resources ==

- [[http://vislab-ccom.unh.edu/~schwehr/Classes/2011/esci895-researchtools/ Class Web Page]] ""Under construction!!!""
- [[Researchtools.ccom.nh]] - Ubuntu Linux server (actually a virtual machine) for use during class projects

== Lectures ==

- \* 1 Introduction - topics that will be covered
- \* [[Lec 2 Research Tools 2011]] - Getting started - IRC via Firefox Chatzilla, the CCOM wiki, logging in to researchtools.ccom.nh
- \* Lecture 3 - 6-Sept-2011
- \* Lecture 4 - 8-Sept-2011 - VMWare, Short lecture for brown bag seminar

Please note that all contributions to CCOMwiki may be edited, altered, or removed by other contributors. If you do not want your writing to be edited mercilessly, then do not submit it here.

You are also promising us that you wrote this yourself, or copied it from a public domain or similar free resource (see [CCOMwiki:Copyrights](#) for details). **Do not submit copyrighted work without permission!**

# Manual:\$wgRawHtml

HTML: \$wgRawHtml	
Allow raw, unchecked HTML in <html>...</html> sections.	
<b>Introduced in version:</b>	1.3.4
<b>Removed in version:</b>	<i>still in use</i>
<b>Allowed values:</b>	(boolean)
<b>Default value:</b>	false

Other settings: [Alphabetical](#) | [By Function](#)

- Toolbox

## Details [\[edit\]](#)

When `$wgRawHtml = true`; the wiki will allow you to insert raw unchecked HTML. However, you must embed your html within the `<html>...</html>` tags so that mediawiki can differentiate it.

**Warning:** This is very dangerous on a publicly editable site, because it allows for arbitrary JavaScript code to be inserted, opening the door for [session hijacking](#). Thus, you shouldn't enable it unless you've restricted editing to trusted users only with `$wgGroupPermissions` (version 1.3.x and 1.4.x can use `$wgWhitelistEdit`). See [Manual:Preventing access](#) for more information on restricting write access.

**Note:** This option does **not** affect how wikicode outside of `<html>...</html>` tags is handled.

**Note:** If you have `$wgRawHtml` turned on and you notice some HTML being stripped out, you may need to turn off `$wgUseTidy`.

## Is enabling raw HTML necessary? [\[edit\]](#)

Some HTML tags are permitted in wikitext, even with `$wgRawHtml=false`. See [meta:Help:HTML in wikitext](#). The vast majority of fancy formatting seen on Wikimedia sites is achieved using these limited tags (e.g. tables with CSS style tags). If you can make do with these limitations (leave `$wgRawHtml=false`), your wiki will be more secure.

Also note that the "limited" wiki syntax is actually a deliberate design feature of wikis. It is a compact simplified markup which is easily understood even by non-technical users, easily visualised in diff displays, and discourages stylistic tinkering in favour of getting on with writing useful/interesting text.

Extension Discussion Read Edit View history Search

# Extension:Google Maps

Introduction - Installation - Editor's Map icon - Coding instructions - Compatibility - Languages - Developers - Talk

Maps are a great way to present information, and the **Google Maps Extension** brings the coolness of interactive, annotated maps to your wiki. With Google Maps Extension, you can:

- Spice up articles with maps of anywhere in the world
- Marvel at detailed street maps and stunning satellite imagery
- Use the interactive **editor's map** to add markers and colored paths with wiki-fied captions
- Look up cities, addresses, and businesses with the built-in search engine

**Contents** [hide]

- 1 Google Maps Javascript API
- 2 What does it do?
- 3 How to Install?
- 4 Screenshot

- 8 External links

## Google Maps Javascript API [edit]

Note: The Google Maps Javascript API Version 2 used by this extension has been officially deprecated as of May 19, 2010 by Google.

## What does it do? [edit]

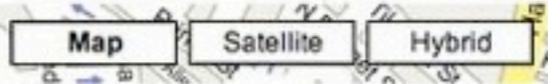

The extension hooks into your MediaWiki installation in two ways: first, it defines a `<googlemap>` tag that translates a special **syntax** into a map

## \* Demonstration - Processing weather data

For this section, you do not need to try to follow along. Just watch what I am doing. The goal is to give you a feeling for what we will be covering. I do not expect you to understand all the steps just yet. It will take us a number of classes to cover all of this material.

This material has also been written up here on my blog:

[http://schwehr.org/blog/archives/2011-09.html#e2011-09-05T19\\_50\\_00.txt](http://schwehr.org/blog/archives/2011-09.html#e2011-09-05T19_50_00.txt)

First, log into a linux computer and setup a project directory.

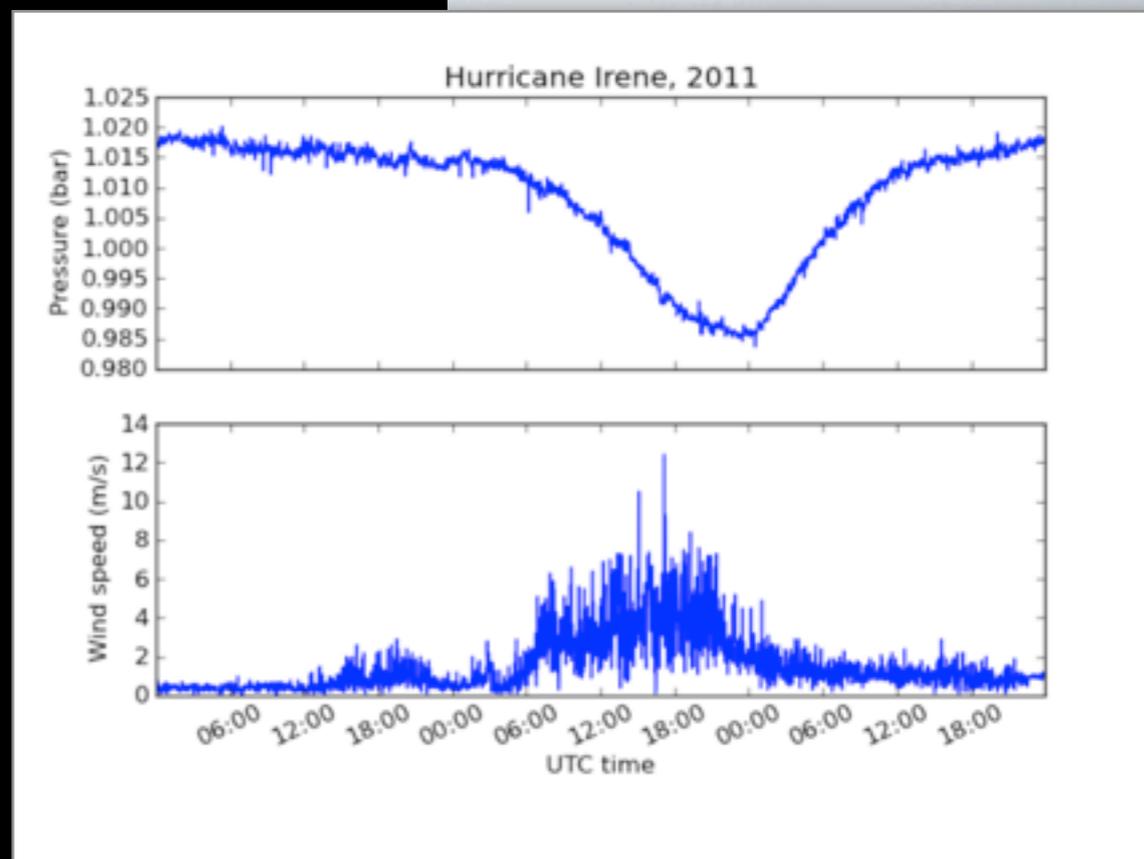

```
#+BEGIN_SRC sh
ssh researchtools.com.nh # or use putty
mkdir wx
cd wx # wx is short for "weather"
#+END_SRC
```

Check out the weather data that is available over the CCOM internal network. socat is a network data helper. It can dump what it sees from a network connection, pass it to other programs, or forward the data.

```
#+BEGIN_SRC sh
socat TCP4:datalogger1.com.nh:36000 - | head
#+END_SRC
```

You should see some [NMEA](#) weather data.

```

### PYTHON DEVELOPMENT - HURRICANE IRENE

Today I gave a run through of a portion of what I aim to teach this semester in research tools. I wanted to make a demonstration of going from a sensor in the world, creating a parser for the data it produces, plotting up some results and releasing the code to the world. I'm using the CCOM weather station as an example. Andy and Ben got the Airmar PB150 setup quite a while ago. It spits out NMEA over a serial port at 4800 baud. I use my serial-logger script to read the serial port and rebroadcast the data over the internal network for anyone who is interested. Here is using [socat](#) to grab a few lines of the data:

```
socat TCP4:datalogger1:36000 - | head
$HCHDT,26.2,T*1F,rccom-airmar,1314661980.3
$GPVTG,275.1,T,290.5,M,0.1,N,0.1,K,D*29,rccom-airmar,1314661980.38
$GPZDA,235300,29,08,2011,00,00*4E,rccom-airmar,1314661980.45
$WIMWV,143.9,R,1.9,N,A*24,rccom-airmar,1314661980.52
$GPGGA,235300,4308.1252,N,07056.3764,W,2,9,0.9,37.2,M,,,,*08,rccom-airmar,1314661980.64
$WIMDA,30.0497,I,1.0176,B,17.8,C,,,,,167.2,T,182.6,M,1.9,N,1.0,M*2A,rccom-airmar,1314661980.79
$HCHDT,26.2,T*1F,rccom-airmar,1314661980.82
$WIMWD,167.2,T,182.6,M,1.9,N,1.0,M*5C,rccom-airmar,1314661980.9
$WIMWV,141.0,T,1.9,N,A*29,rccom-airmar,1314661980.97
$WIMWV,144.5,R,1.9,N,A*2F,rccom-airmar,1314661981.02
```

The ",rccom-airmar,1314661980.97" is added by my serial-logger giving each line a station name and a UNIX UTC timestamp. Eric Raymond (ESR) has put together a very nice document on NMEA sentences: [NMEA Revealed](#). It describes many of the sentences in common use. What do we have for contents? The unix "cut" command can pull out the "talker" + "sentence" part of each line. The -d specifies that the sort with "-u" for collapsing the output to the unique list of lines can get the job done.

```
egrep -v '^[#]' ccom-airmar-2011-08-28 | cut -d, -f1 | sort -u
$GPGGA
$GPVTG
$GPZDA
$HCHDT
$PNTZNT
$WIMDA
$WIMWD
$WIMWV
```

All of those messages (except my custom PNTZNT message for NTP clock status) are documented in ESR's NMEA Revealed.

To look at the weather from Hurricane Irene, we want to look at the MDA is listed as "Obsolete"

```

Time, Position and fix related data for a GPS receiver.

```

      1           2           3 4           5 6 7 8 9 10 | 11 12 13 14 15
      |           |           | |           | | | | | | | | | |
$--GGA,hhmmss.ss,l111.11,a,yyyyy.yy,a,x,xx,x.x,x.x,M,x.x,M,x.x,xxxx*hh<CR><LF>

```

### Field Number:

1. Universal Time Coordinated (UTC)
2. Latitude
3. N or S (North or South)
4. Longitude
5. E or W (East or West)
6. GPS Quality Indicator,
  - 0 - fix not available,
  - 1 - GPS fix,
  - 2 - Differential GPS fix (values above 2 are 2.3 features)
  - 3 = PPS fix
  - 4 = Real Time Kinematic
  - 5 = Float RTK
  - 6 = estimated (dead reckoning)
  - 7 = Manual input mode
  - 8 = Simulation mode
7. Number of satellites in view, 00 - 12
8. Horizontal Dilution of precision (meters)
9. Antenna Altitude above/below mean-sea-level (geoid) (in meters)
10. Units of antenna altitude, meters

To look at the weather from Hurricane Irene, we want to look at the MDA is listed as "Obsolete" by ESR according to a NMEA 2009 doc, but that is the message we want to use. In python we could parse this by hand. Here is an example "Meteorological Composite" NMEA line:

```
$WIMDA,30.0497,I,1.0176,B,17.8,C,,,,,,,,,167.2,T,182.6,M,1.9,N,1.0,M*2A
```

Python makes it easy to do splits on strings and use any separator that we line. For example, we could do:

```
fields = line.split(',')
```

This would break apart each of the blocks. However, this doesn't scale well and does not tell us when a message is too corrupted to be usable data. I have written a large number of [regular expressions](#) in Python for NMEA sentences based on emails that I get from the USCG Healy.

I wanted to start turning those into a library that I could make usable by anyone. I created the nmea decoder package. I used mercurial (hg) for version control and uploaded it to bitbucket as ([nmeadec](#)). It's pure python and simpler (but less powerful) than gpsd. I really like the way that python's regular expression syntax lets you name the fields and retrieve a named dictionary when messages are decoded. You can find the regular expression for MDA here: [nmeadec/raw.py - line 39](#). With nmeadec 0.1 written, I can now parse NMEA in Python like this:

```
msg = nmeadec.decode(line)
```

The [PasteScript](#) package gave a helping hand for creating a basic python package. I did this from inside of a virtualenv to protect the system and fink python space.

```
virtualenv ve
cd ve
source bin/activate
mkdir src
paster create nmeadec
```

I answered a whole bunch of questions and it setup a simple package using [setuptools/distribute](#).

Since you are not creating that package and might want to follow along, you can grab the package in src (and skip running the paster command to create a new project).

```
hg clone https://schwehr@bitbucket.org/schwehr/nmeadec
```

Because I set this up in a terminal using a virtualenv being active, then I can use this command to setup the package for development without funny python PATH hacks:

```
cd nmeadec
python setup.py develop
```

## Obsolete sentences

The following NMEA sentences have been designated "obsolete" in a publicly available NMEA document dated 2009.

APA - Autopilot Sentence "A"

BER - Bearing & Distance to Waypoint, Dead Reckoning, Rhumb Line

BPI - Bearing & Distance to Point of Interest

DBK - Depth Below Keel

DBS - Depth Below Surface

DRU - Dual Doppler Auxiliary Data

GDA - Dead Reckoning Positions

GLA - Loran-C Positions

GOA - OMEGA Positions

GXA - TRANSIT Positions

GTD - Geographical Position, Loran-C TDs

GXA - TRANSIT Position

HCC - Compass Heading

HCD - Heading and Deviation

HDM - Heading, Magnetic

HDT - Heading, True

HVD - Magnetic Variation, Automatic

HVM - Magnetic Variation, Manually Set

IMA - Vessel Identification

MDA - Meteorological Composite

To look at the weather from Hurricane Irene, we want to look at the MDA is listed as "Obsolete" by ESR according to a NMEA 2009 doc, but that is the message we want to use. In python we could parse this by hand. Here is an example "Meteorological Composite" NMEA line:

```
$WIMDA,30.0497,I,1.0176,B,17.8,C,,,,,,,,,167.2,T,182.6,M,1.9,N,1.0,M*2A
```

Python makes it easy to do splits on strings and use any separator that we line. For example, we could do:

```
fields = line.split(',')
```

This would break apart each of the blocks. However, this doesn't scale well and does not tell us when a message is too corrupted to be usable data. I have written a large number of [regular expressions](#) in Python for NMEA sentences based on emails that I get from the USCG Healy.

I wanted to start turning those into a library that I could make usable by anyone. I created the nmea decoder package. I used mercurial (hg) for version control and uploaded it to bitbucket as ([nmeadec](#)). It's pure python and simpler (but less powerful) than gpsd. I really like the way that python's regular expression syntax lets you name the fields and retrieve a named dictionary when messages are decoded. You can find the regular expression for MDA here: [nmeadec/raw.py - line 39](#). With nmeadec 0.1 written, I can now parse NMEA in Python like this:

```
msg = nmeadec.decode(line)
```

The [PasteScript](#) package gave a helping hand for creating a basic python package. I did this from inside of a virtualenv to protect the system and fink python space.

```
virtualenv ve
cd ve
source bin/activate
mkdir src
paster create nmeadec
```

I answered a whole bunch of questions and it setup a simple package using [setuptools/distribute](#).

Since you are not creating that package and might want to follow along, you can grab the package in src (and skip running the paster command to create a new project).

```
hg clone https://schwehr@bitbucket.org/schwehr/nmeadec
```

Because I set this up in a terminal using a virtualenv being active, then I can use this command to setup the package for development without funny python PATH hacks:

```
cd nmeadec
python setup.py develop
```

Now, we need to pull out the data. I created a little module called "process\_wx.py". It let's you down sample the data there were more than 86,000 MDA messages in a day.

```
from __future__ import print_function
import nmeadec

def get_wx(filename, nth=None):
    pres = []
    speed = []
    timestamps = []
    mda_count = 0 # for handling the nth MDA entry

    for line in file(filename):
        try:
            msg = nmeadec.decode(line)
        except:
            continue

        try:
            if msg['sentence'] != 'MDA': continue
        except:
            print ('trouble:',line,msg)

        mda_count += 1
        if nth is not None and mda_count % nth != 1:
            continue # skip all but the nth. start with first

        #print (msg['pressure_bars'], msg['wind_speed_ms'])
        pres.append(msg['pressure_bars'])
        speed.append(msg['wind_speed_ms'])
        timestamps.append(float(line.split(',')[0]))

    return {'pres':pres, 'speed':speed, 'timestamps':timestamps}
```

We can then use that in ipython to see how it works:

```
ipython -pylab # Ask for ipython to preload lots
import process_wx
data = process_wx.get_wx('ccom-airmar-2011-08-28')
data.keys()
['timestamps', 'speed', 'pres']
len(data['timestamps'])
86361
data = process_wx.get_wx('ccom-airmar-2011-08-28', nth=10)
len(data['timestamps'])
8637
```

Now, we need to pull out the data. I created a little module called "process\_wx.py". It let's you down sample the data there were more than 86,000 MDA messages in a day.

```
from __future__ import print_function
import nmeadec

def get_wx(filename, nth=None):
    pres = []
    speed = []
    timestamps = []
    mda_count = 0 # for handling the nth MDA entry

    for line in file(filename):
        try:
            msg = nmeadec.decode(line)
        except:
            continue

        try:
            if msg['sentence'] != 'MDA': continue
        except:
            print ('trouble:',line,msg)

        mda_count += 1
        if nth is not None and mda_count % nth != 1:
            continue # skip all but the nth. start with first

        #print (msg['pressure_bars'], msg['wind_speed_ms'])
        pres.append(msg['pressure_bars'])
        speed.append(msg['wind_speed_ms'])
        timestamps.append(float(line.split(',')[-1]))

    return {'pres':pres, 'speed':speed, 'timestamps':timestamps}
```

We can then use that in ipython to see how it works:

```
ipython -pylab # Ask for ipython to preload lots
import process_wx
data = process_wx.get_wx('ccom-airmar-2011-08-28')
data.keys()
['timestamps', 'speed', 'pres']
len(data['timestamps'])
86361
data = process_wx.get_wx('ccom-airmar-2011-08-28', nth=10)
len(data['timestamps'])
8637
```

<http://ipython.org/>

Now to load 3 days:

```
import process_wx
from numpy import array

# explicit:
days = []
days.append( process_wx.get_wx('ccom-airmar-2011-08-27', nth=10) )
days.append( process_wx.get_wx('ccom-airmar-2011-08-28', nth=10) )
days.append( process_wx.get_wx('ccom-airmar-2011-08-29', nth=10) )

# Does the same as the above, but in one line with "list comprehensions"
days = [ process_wx.get_wx('ccom-airmar-2011-08-'+str(day), nth=10) for day in (27, 28, 29) ]

# We then have to get the pressure, temperature, and timestamps for the 3 days and combine them
# This is pulling out a few too many tricks in one line!
pres = array ( sum( [ day['pres'] for day in days ], [ ] ) )
speed = array ( sum( [ day['speed'] for day in days ], [ ] ) )
timestamps = array ( sum( [ day['timestamps'] for day in days ], [ ] ) )
```

We now have the data loaded and it's time to take a look at it!

```
min(data['speed']),max(data['speed'])
(0.0, 12.4)
min(data['pres']),max(data['pres'])
(0.983700000000000002, 1.0201)
average(data['speed'])
1.52199
average(data['pres'])
1.0084
median(data['speed'])
1.0
median(data['pres'])
1.013650
```

And finally, we would like to make a plot of these parameters. There are several plotting packages for python. Probably the most flexible and powerful is [matplotlib](http://matplotlib.sourceforge.net/). It is very similar to plotting in matlab.

```
# Top plot
subplot(211)
ylabel('Pressure (bar)')
xlabel('')

# Turn off labels for the xaxis
ax=gca()
ax.xaxis_date()
old_xfmt = ax.xaxis.get_major_formatter()
xfmt=DateFormatter('')
ax.xaxis.set_major_formatter(xfmt)

title('Hurricane Irene, 2011')
plot (data['dates'],data['pres'])

# Bottom plot
subplot(212)
xlabel('UTC time')
ylabel('Wind speed (m/s)')

# Label x-axis by Hour:Minute
xticks( rotation=25 )
subplots_adjust(bottom=0.2)
ax=gca()
ax.xaxis_date()
xfmt=DateFormatter('%H:%M')
ax.xaxis.set_major_formatter(xfmt)

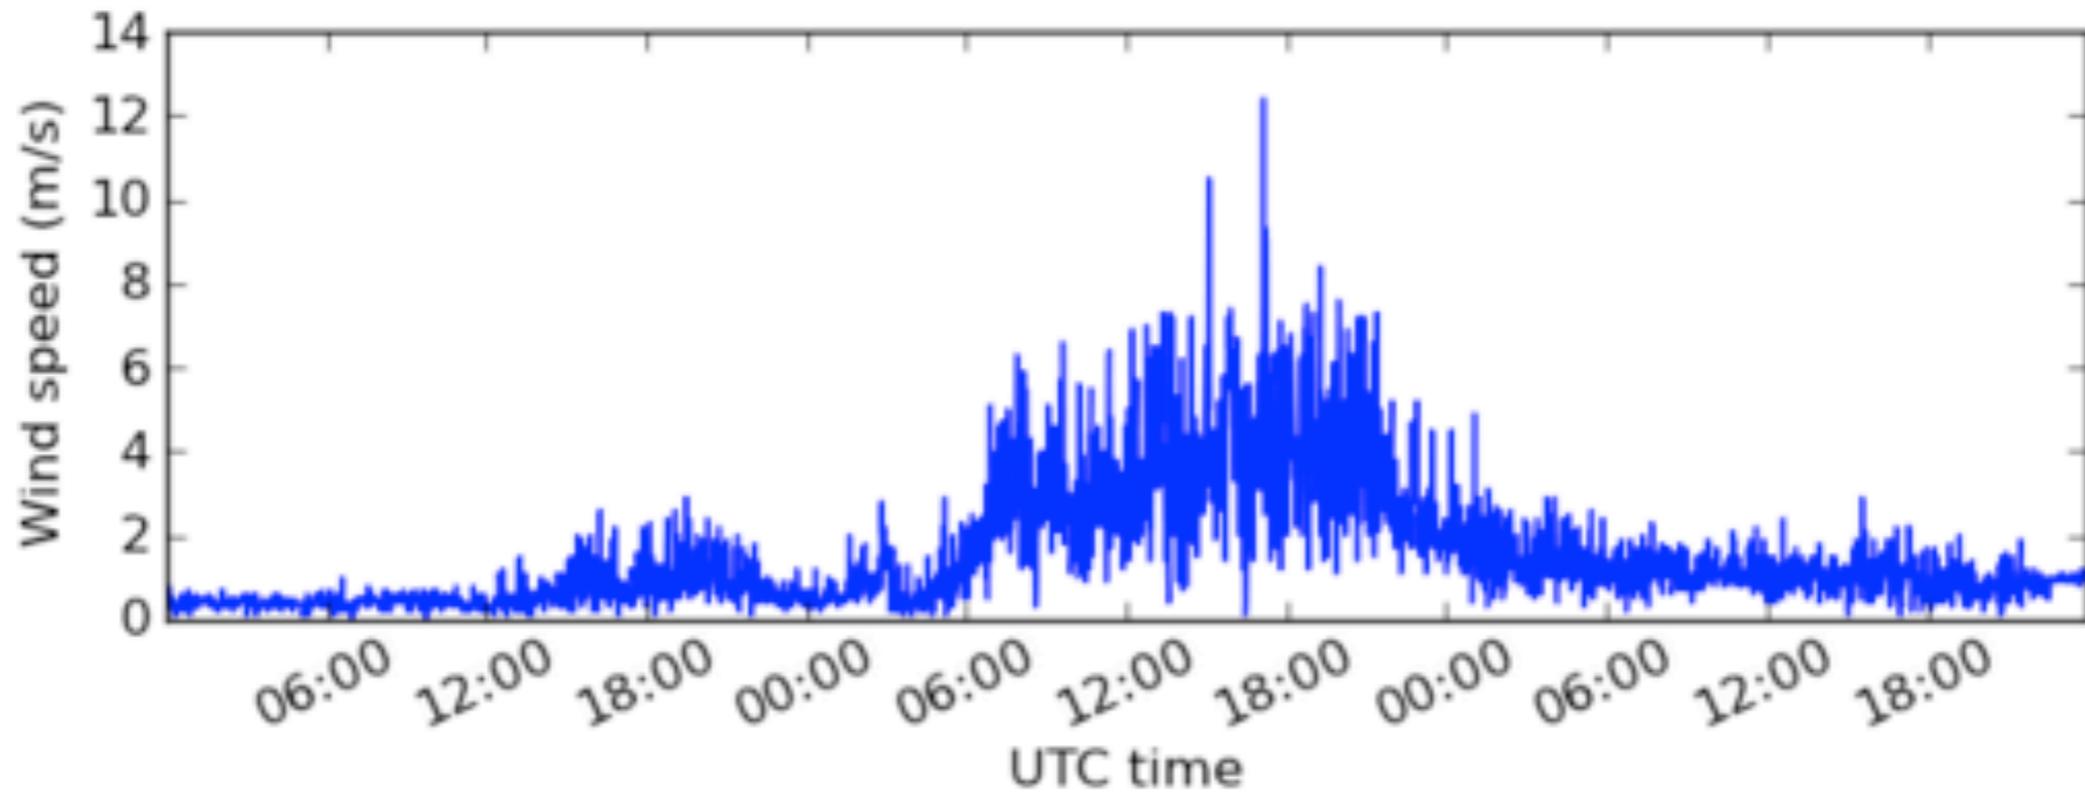

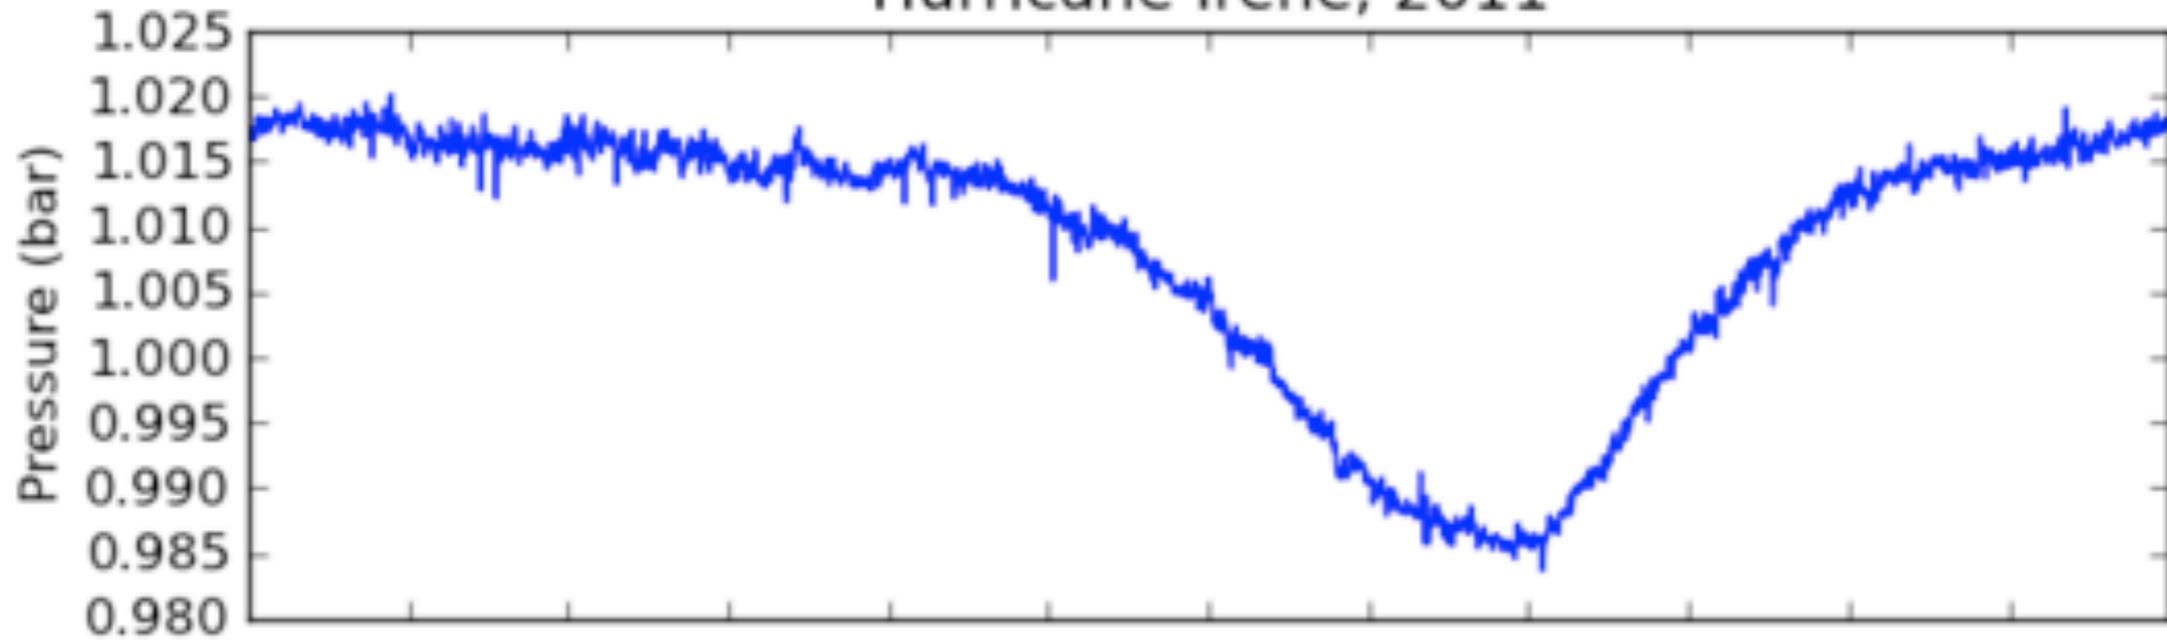

# 30.6 (meters / second) = 68.5 mph
plot (data['dates'],data['speed'])
title('')
```

<http://matplotlib.sourceforge.net/>

I used [GraphicsMagick](#) (fork of ImageMagick) to resize the image to have a width of 600 pixels. Yes, I could have set the output size in matplotlib.

```
convert -resize 600 ~/Desktop/raw-fig.png final-figure.png
```

# Hurricane Irene, 2011

```
Terminal Shell Edit View Window Help
schwehr — schwehr@researchtools: ~ — ssh — 100x8
schwehr@researchtools:~$ egrep some-string
^C
schwehr@researchtools:~$ # Control-C or q (lower case Q) are often the quit keys
schwehr@researchtools:~$
```

Check for common characters to confuse. It is easy to replace a "1" (number one) with an "l" ([Lima](#)) or vice versa if the fonts you have in your terminal and web browser make those two characters. Make sure you are using the right quote character (e.g. ", ', or ` are all different). Another pair of characters that is sometime trouble are the 0 (zero) and O (Oscar).

Note that the pipe character is a vertical bar: "|". This character is sometimes two vertical dashes. On US keyboards it is located between the delete and return/enter keys and is the shift of "\".

**\*\* What to do if you get stuck?**

Before we get into the commands, we need to talk about what to do if things get stuck. If you mistype a command and it just sits there doing nothing, you should first try holding down the "control" key and hitting the "C" key. This sends a "break" or "kill" message to the program. This is often written as "Ctrl-C" or "C-c". Here is a command that hangs. I then use Ctrl-C to get out of it. The bash shell responds with a "^C" and gives a prompt again.

```
#+BEGIN_EXAMPLE
egrep some-string
^C
#+END_EXAMPLE
```

If the command really gets stuck and does not respond to the Ctrl-C, you can close the terminal window and open a new window. Later on, you will learn fancier techniques for controlling programs (also known as processes), but this will work for now.

```

--block-size=SIZE	use SIZE-byte blocks. See SIZE format below
-B, --ignore-backups	do not list implied entries ending with ~
-c	with -lt: sort by, and show, ctime (time of last modification of file status information) with -l: show ctime and sort by name otherwise: sort by ctime
-C	list entries by columns
--color[=WHEN]	colorize the output. WHEN defaults to `always' or can be `never' or `auto'. More info below
-d, --directory	list directory entries instead of contents, and do not dereference symbolic links
-D, --dired	generate output designed for Emacs' dired mode
-f	do not sort, enable -aU, disable -ls --color

DF(1) User Commands DF(1)
NAME
df - report file system disk space usage
SYNOPSIS
df [OPTION]... [FILE]...
DESCRIPTION
This manual page documents the GNU version of df. df displays the amount of disk space available on the file system containing each file name argument. If no file name is given, the space available on all currently mounted file systems is shown. Disk space is shown in 1K blocks by default, unless the environment variable POSIXLY_CORRECT is set, in which case 512-byte blocks are used.
If an argument is the absolute file name of a disk device node containing a mounted file system, df shows the space available on that file system rather than on the file system containing the device node (which is always the root file system). This version of df cannot show the space available on unmounted file systems, because on most kinds of systems doing so requires very nonportable intimate knowledge of file system structures.
OPTIONS
Show information about the file system on which each FILE resides, or all file systems by default.
Manual page df(1) line 1
```

You are in a “pager.” Use the “q” key to quit out of the man page. The space bar gets the next page.

**AUTHOR**

Written by Torbjorn Granlund, David MacKenzie, and Paul Eggert.

**REPORTING BUGS**

Report df bugs to [bug-coreutils@gnu.org](mailto:bug-coreutils@gnu.org)  
GNU coreutils home page: <http://www.gnu.org/software/coreutils/>  
General help using GNU software: <http://www.gnu.org/gethelp/>  
Report df translation bugs to <http://translationproject.org/team/>

**COPYRIGHT**

Copyright © 2010 Free Software Foundation, Inc. License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>.  
This is free software: you are free to change and redistribute it. There is NO WARRANTY, to the extent permitted by law.

**SEE ALSO**

The full documentation for **df** is maintained as a Texinfo manual. If the **info** and **df** programs are properly installed at your site, the command

**info coreutils 'df invocation'**

should give you access to the complete manual.

winop (3blt)     - Perform assorted window operations
schwehr@researchtools:~$ man sort
```

**NAME**

sort - sort lines of text files

**SYNOPSIS**

sort [OPTION]... [FILE]...

sort [OPTION]... --files0-from=F

**DESCRIPTION**

Write sorted concatenation of all FILE(s) to standard output.

Mandatory arguments to long options are mandatory for short options too. Ordering options:

**-b, --ignore-leading-blanks**  
ignore leading blanks

**-d, --dictionary-order**  
consider only blanks and alphanumeric characters

**-f, --ignore-case**  
fold lower case to upper case characters

**-g, --general-numeric-sort**

Manual page sort(1) line 1

# anything with exactly two letters
ls ??
# 10 11 12 13

# the letter "1" followed by any single character
ls 1?
# 10 11 12 13
#+END_SRC

You can get fancier by using square brackets instead
of characters or ranges by putting a dash in between.
It's best to just see some examples.

#+BEGIN_SRC sh
# List files that are one character of the number 2 through 5
ls [2-5]
# 2 3 4 5
|
# List files that start with 1 and have a 1 or 3 following.
ls 1[13]
# 11 13

# Combine the * and [] to ask for any file ending in 1 or 3
ls *[13]
# 1 11 13 3

# Here we are using a special system directory for an example using a
# range of alphabetical characters (x, y, & z).
# Please do not worry about what these files are
ls /sbin/*[x-z]
# /sbin/fsck.minix /sbin/getty /sbin/iwspy /sbin/mkfs.minix /sbin/pam_tally
#+END_SRC

* Using a Virtual Machine (VM) version of Ubuntu Linux

Before we go any more into the shell, it is worth taking the time to
show you how to be able to do this type of thing on your own computer
and not always have to log into researchtools.com.nh.
```
